

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

Read more about Early Journal Content at <http://about.jstor.org/participate-jstor/individuals/early-journal-content>.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.

DIPHTHERIA.

Alabama—Tuscaloosa—A Correction.

In the Public Health Reports of May 12, page 1184, appeared a report that up to May 7 there had been notified among the students of the University of Alabama 204 cases of diphtheria, and in the issue of May 26, page 1312, that up to May 20 there had been notified in Tuscaloosa among the students at the university a total of 277 cases of diphtheria since the outbreak began and 15 cases among persons not attending the university.

DIPHTHERIA—Continued.

It should have been specified that 30 of the above were clinical cases of diphtheria, the other 262 being diphtheria carriers. From the health officer's and epidemiologist's point of view the carrier foci are of greater importance than the clinical foci. Clinical cases are usually more readily recognized and more easily controlled than the carriers, which as truly constitute foci from which the disease may spread. The attention given to the control of carrier cases as well as clinical cases has undoubtedly been an important factor in controlling the outbreak at Tuscaloosa.

SCARLET FEVER.

See Diphtheria, measles, scarlet fever, and tuberculosis, page 1484.

SMALLPOX.**Minnesota.**

Collaborating Epidemiologist Bracken reported by telegraph that during the week ended June 3, 1916, one new focus of smallpox infection was reported in Minnesota, five cases of the disease having been notified in Mankato Township, Blue Earth County.

Missouri—Scott County.

Senior Surg. Gassaway reported that 22 cases of smallpox occurred among laborers working on the St. Louis Southwestern Railroad near Illmo, Scott County, Mo. The patients were living in box cars. The fact that they had smallpox was discovered about May 24, 1916.

Porto Rico.

Surg. King reported by telegraph May 31, 1916, that during the week ended May 26, 1916, additional cases of smallpox were reported in Porto Rico as follows: Arroyo 5, Cidra 2, Juncos 1, Rio Piedras 4, San Juan 30, Trujillo Alto 9.
